Department of Mathematics

School of Mathematics and Computer Sciences

Syllabus for Integrated M.Sc. Mathematics based on NEP 2020: NCrF/CUTN

(For those admitted in 2023 and later)

Central University of Tamil Nadu

Thiruvarur – 610 005

Department of Mathematics
School of Mathematics and Computer Sciences
Central University of Tamil Nadu, Thiruvarur

A. Vision

To be an internationally acclaimed Department of Mathematics for its teaching and research that also caters to the educational and occupational needs of the local community.

B. Mission

M1 - To provide a world class teaching and research infrastructure.
M2 - To promote professional working environment that supports innovative thinking and teamwork.
M3 - To inculcate the art of asking questions, formulating the problem, solving the problem and interpreting the solution for possible applications.

C. Programme Outcomes (PO)

PO1: Acquire basic knowledge on logic, tools and techniques for formulating problems in to a model.
PO2: Motivate the students to develop problem solving skills.
PO3: Ability to work in teams via group discussion and class room interaction.
PO4: Acquire skills to qualify competitive exams.
PO5: Enhance skills to develop critical thinking
PO6: Develop innovative skills, team work, leadership quality and ethical values
PO7: Students are directed towards lifelong learning through reading course and project

D. PO to Mission Statement Mapping

	PO1	PO2	PO3	PO4	PO5	PO6	PO7
M1	1	1	1	1	1	1	1
M2	1	1	1	1	1	1	1
M3	1	1	1	1	1	1	1

E. Programme Specific Outcomes (PSO)

PSO1: Understand the abstract concepts in Algebra, Analysis and Geometry.
PSO2: Inculcate critical and analytical thinking to solve problems.
PSO3: Students are motivated towards inter disciplinary research.
PSO4: Focus on examinations like CSIR, GATE and NBHM etc., through assignments.
PSO5: Students are encouraged to do research in reputed institutions.
PSO6: Capable of solving real world problems independently.
PSO7: Communicate Mathematical concepts efficiently.
PSO8: Develop programming skills and problem solving skills to study the mathematical concepts effectively.

F. PO to PSO Mapping

	PSO1	PSO2	PSO3	PSO4	PSO5	PSO6	PSO7	PSO8
PO1	1	1	0	1	1	0	1	0
PO2	1	1	0	1	1	1	1	1
PO3	0	0	1	1	0	1	1	0
PO4	1	1	0	1	1	0	1	1
PO5	1	1	1	1	1	1	1	1
PO6	0	1	1	1	0	0	1	1
PO7	1	1	1	0	0	1	0	1

G. Course Structure

Semester	Course code	Course title	Type	Credits
I	MAT1011	Mathematics for Sciences	Major	4

VI	MATSE01	Numerical analysis – Lab	SEC	2
		Total		**48**
For students exiting after three years (Bachelor's Degree (B. Sc.) with 143 credits				
VII	MAT1071	Groups and Rings	Major	4
VII	MAT1072	Analysis	Major	4
VII	MAT1073	Advanced Linear Algebra	Major	4
VII	MAT1074	Advanced Complex Analysis	Major	4
VII	MAT1075	Ordinary Differential Equations	DSE	4
VII	MAT1076	Discrete Mathematics	DSE	3
VII	MATVA02	Advanced LaTex (or) Courses can be chosen from the Times Group (Online)	VAC	2 (Not included)
VIII	MAT1081	Field Theory	Major	4
VIII	MAT1082	Topology	Major	4
VIII	MAT1083	Measure and Integration	Major	4
VIII	MAT1084	Partial Differential Equations	Major	4
VIII	MAT1085	Multivariate Calculus	Major	4
VIII	MAT1086	Number Theory	Major	3
VIII	MATVA03	Research Methodology and Publication Ethics	VAC	2
		Total		**48**

For Students exiting after four years (Bachelor's Degree - Honours / Bachelor's Degree - Honours with Research) with 188 Credits

1. Students who wish to exit with **4-Year UG Degree (Honours)** have to complete 4 Major courses and 1 Value Added course (MAT1081, MAT1082, MAT1083, MAT1084 or MAT1085, MATVA03) along with a Mini project (Course Code: MAT1087) (4 credits) during eighth semester.
2. Students who wish to exit with **4-Year UG Degree (Honours with Research)** have to complete 3 Major courses and 1 Value Added course (MAT1081, MAT1082, MAT1083, MATVA03) along with a Major project (Course Code: MAT1088) (8 credits) during eighth semester.

Semester	Course code	Course title	Type	Credits
IX	MAT1091	Functional Analysis	Major	4
IX	MAT1092	Probability Theory	Major	4
IX	MATSE02	*Computational Mathematics*	SEC	3
IX	MATON02	MOOC/NPTEL/SWAYAM Course#	DSE	4

List of elective courses

Sl. No.	Course code	Course title	Credits
1	MATEC01	Mathematical Methods	4
2	MATEC02	Fluid Dynamics	4
3	MATEC03	Transformation Groups	4
4	MATEC04	Design & Analysis of Algorithms	4
5	MATEC05	Nonlinear Programming	4
6	MATEC06	Introduction to Lie Algebras	4
7	MATEC07	Advanced Partial Differential Equations	4
8	MATEC08	Differential Geometry	4
9	MATEC09	Delay Differential equations	4
10	MATEC10	Foundations of Geometry	4
11	MATEC11	Commutative algebra	4

12	MATEC12	Advanced graph theory	4
13	MATEC13	Mechanics	4
14	MATEC14	Discrete Dynamical Systems	4
15	MATEC15	Combinatorial Mathematics	4
16	MATEC16	Introduction to Game Theory	4

Open Electives

Sl. No.	Course code	Course title	Credits
1	MATOE01	Python for Sciences	3
2	MATOE02	Mathematics for the real World	3
3	MATOE03	History of Mathematics	3
4	MATOE04	Mathematics in Kolam	3

H. Evaluation Procedure

Evaluation is based on Internal Assessment and End Semester Examination. The Internal Assessment consists of the following components:

Internal Assessment Tests, Assignments, Practical, Project works, Quiz, seminar, open-book tests, viva voce and online tests via platforms Moodle, MOOCs, Google Classroom, etc.,

	Internal Marks	End Semester Marks	Total
Theory Courses	40	60	100
Practical Courses	Continuous Internal Assessment		100
Project	60	40	100
Reading Course	40	60	100

Internal Assessment evaluation pattern will differ from course to course for each semester. This will have to be declared to the students at the beginning of each semester.

I. Evaluation Scheme

Marks \ CO	CO1	CO2	CO3	CO4	CO5	Total
Internal	8	8	8	8	8	40
External	12	12	12	12	12	60
Total	**20**	**20**	**20**	**20**	**20**	**100**

J. Passing Minimum

For a pass in each theory course, a student should secure a minimum of 50% marks in the End Semester Examinations (ESE) and a minimum of 50% marks in aggregate (i.e., internal and ESE marks put together). For a pass in lab course, a student should secure 50% marks and for a pass in the Project, a student should secure a minimum of 50% marks in total.

K. Practical

The assessment of practical courses will be done on the basis of Continuous Internal Assessment consists of the students' performance in the laboratory, regular attendance, the number of experiments performed, on-time submission of observation and record notes, and written/viva-voce examinations.

L. Internship

Students should undergo Internship/ Apprenticeship for at least 2-weeks duration in an Industry / Organization / Lab Training with faculty or researchers in their own or other HEIs / research institutions during the summer vacation at the end of 4^{th} and 8^{th} semesters. The Summer Internship report submitted by the student will be evaluated during the subsequent semester and the credit shall be accounted in the 5^{th} semester and 10^{th} semester. After completing the internship, the student has to submit the report of the internship forwarded/signed by the internship supervisor. Internal evaluation will be done by the committee consists of three faculty members from the department nominated by DRC.

Internship evaluation is done on the basis of Internal (25% based on the report and 25% based on the presentation given by the student in the Department) and External (60% by the supervisor from own or other HEIs).

M. Project

Students will carry out project work in the tenth semester on any one of the topics under the guidance of faculty or researchers in their own or other HEIs / research institutions. Finding an advisor who is willing to supervise the work of a student is solely the responsibility of the student. Preferably, the student should have identified a supervisor by the first week of the commencement of the final year. If the student wants to do project under an external guide from other HEIs/research institutions, the internal evaluation will be done by the committee consists of three faculty members from the department nominated by DRC. The evaluation of the Project work will be based on the dissertation and a Viva-Voce examination by project evaluation committee (PEC) consisting of the (internal) supervisor, an internal examiner (other than the supervisor) and an External/internal Examiner. The internal examiner and the external examiner shall be appointed by the supervisor. The dissertation work is evaluated under two categories

(i) Internal Assessment (IA), which is a continuous assessment and will be done by his/her supervisor
(ii) End semester Assessment, which involves evaluation of dissertation and viva voce, will be done by PEC members during Project viva.

Total marks allotted for Project is 100 marks with the following criteria

Internal Assessments	: 60%
End Semester Assessments	: 40%

The students are encouraged to publish their project work in a peer-reviewed journal/ Conference/ Seminar/ Patented.

N. Online Couse (MOOC/NPTEL/SWAYAM/e_Pathshala/etc.,)

A student should undergo two online courses one in 5th semester (4 credit) and the other in 9th semester (4 credit). Registration has to be done in the current semester along with other courses. The student has to choose the course from the list of online courses given by the department. The list of online courses opted by the students along with students' details, content, approval from the department shall be submitted to the Academic Section. Credits earned from a University, which offers the online course can be directly transferred to the respective programme of the candidate after getting due approval from Department and Academic Section. The student has to submit a copy of the course completion certificate to the department.

O. Question Paper Pattern for ESE

Part – A

Answer *<u>ALL</u>* the questions **(10 x 1 = 10 Marks)**

Question Nos: 1 to 10
TEN questions – TWO questions from each unit

Part – B

Answer *<u>ALL the</u>* questions **(5 x 3 = 15 Marks)**
Question Nos: 11-15
FIVE questions – ONE question from each unit with internal choice (either or type)

Part – C

Answer *<u>ALL</u>* questions **(5 x 7 = 35 Marks)**
Question Nos: 16-20
FIVE questions – ONE question from each unit with internal choice (either or type)

P. Eligibility Criteria for the Award of Certificate / Diploma/ Degree

1. A student who wishes to exit the programme with **Under Graduate Certificate** in Mathematics after successfully completing all the courses during the First Year of the Programme (48 credits), have to secure 4 additional credits in work based vocational courses during summer term. Total credit requirements for awarding **Under Graduate Certificate** are 52 (48+4=52). *The department of Economics is offering a Vocational Course 'Financial Services' for first year exiting students.*
2. A student who wishes to exit the program with **Under Graduate Diploma** in Mathematics after successfully completing all the courses during First and Second Years of the Programme (95 credits), have to secure 4 additional credits in work based vocational courses during summer term. Total credit requirements for awarding **Under Graduate Diploma** are 99 (95+4=99). *The department of Economics is offering a Vocational Course 'Basic Financial and Banking Skills' for second year exiting students*
3. A student who wishes to exit the program with **Under Graduate (B. Sc.) Degree** in Mathematics after successfully completing all the courses during First, Second and Third Years of the Programme have to secure 143 credits.

4. Students who have secured ≥75% marks in the first 6 semesters alone are permitted to undertake **4-Year UG Degree (Honours with Research)**. Others are permitted to undertake **4-Year UG Degree (Honours)**. The total credit requirements for awarding **Under Graduate (Honours) / Under Graduate Degree (Honours with Research)** is 188.
   I. Students who wish to undertake **4-Year UG Degree (Honours)** have to complete 4 Major courses (MAT1081, MAT1082, MAT1083, MAT1084 or MAT1085, MATVA03) along with a Mini project (4 credits) during eighth semester.
   II. Students who wish to undertake **4-Year UG Degree (Honours with Research)** have to complete 3 Major courses (MAT1081, MAT1082, MAT1083, MATVA03) along with a Major project (8 credits) during eighth semester.
5. Students will be eligible for the award of **Post Graduate Diploma** in Mathematics after completion of First year of 2-year PG programme. The minimum credits required is 48.
6. Students who secure a minimum of 92 credits from the first and second years of the PG programme, with a minimum of 48 credits in the first year and a minimum of 44 credits in the second year of the programme, will be eligible for the award of **M.Sc. degree** in Mathematics.
7. A student undergoing the Integrated M.Sc. Degree Programme in Mathematics will be eligible for the award of the Integrated M.Sc. Degree in Mathematics, only if the student passes all the exams prescribed for the programme, earning the total credits of 235 as per the Course Structure.

SEMESTER – I

Course Code: MAT1011 **Credit: 4**

Mathematics for Sciences

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the basic theory of permutations, combinations, logic, analytic geometry and statistical quantities,	Remember / Understand
CO 2	Compare the given set of data using correlation	Apply
CO 3	gain knowledge about the regular geometrical figures and their properties	Analyze
CO 4	find PCNF, DCNF, equation of sphere, mean, deviation and covariance.	Evaluate
CO 5	appreciate the importance of counting principle, quantifiers, tangent plane, probability of random variables and understand the correlation and regression coefficients	Create

Syllabus

Units	Content	Hrs.
I	Basic counting principles, permutations and combinations (with and without repetitions), binomial theorem, multinomial theorem, counting subsets, set-partitions, Stirling numbers, principle of inclusion and exclusion.	12
II	Statements, symbolic representation, tautologies, quantifiers, predicates and validity, prepositional logic, connectives, truth table, normal form, PCNF, PDNF.	12
III	Equation of a sphere, tangent plane, plane section of a sphere, finding the center and radius of the circle of intersection, sphere through the circle of intersection.	12
IV	Arithmetic mean, geometric mean, harmonic mean, median, mode, standard deviation, quartile deviation, percentiles, expectation, variance and covariance.	12
V	Correlation and regression, properties of correlation and regression coefficients, applications.	12

Kapoor, Fundamentals of Mathematical Statistics, Sultan Chand & sons, New Delhi, 1994.	

Mapping of Program Specific Outcomes with Course Outcomes

	PSO1	PSO2	PSO3	PSO4	PSO5	PSO6	PSO7	PSO8
CO1	1	1	1	1	1	0	1	1
CO2	1	1	0	1	1	0	1	1
CO3	1	1	0	1	1	1	1	1
CO4	1	1	1	1	1	1	1	1
CO5	1	1	1	1	1	1	1	1

Course Code: MAT1012 **Credit: 2**

Basic Computing Lab

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	comfortably use Libre office, VI editor and necessary basic commands of Linux.	Remember / Understand
CO 2	apply the software in basic mathematical study	Apply
CO 3	draw frequency diagram, histogram and frequency polygons	Analyze
CO 4	find various measures involved in statistics by means of Libre	Evaluate
CO 5	develop data processing skills in Libre office	Create

Syllabus

Units	Content	Hrs.
I	Open Source Software, OpenDocument, OpenDocument filename extensions. Introduction to LibreOffice package, advantages of LibreOffice, features of LibreOffice, Pros and Cons, File formats supported by LibreOffice, LibreOffice Calc, Basic structure, comparison with MS Excel, shortcut operations, creating, saving, and printing a file in LibreOffice Calc, inserting pictures and graphics, exporting files, format properties, creating hyperlinks.	12
II	Toolbox, basic functions, built-in functions, basic math and trigonometry functions, statistical functions, text functions, data visualization through diagrams, creating tables, data sorting and filtering, pivot tables, charts, simple bar, multiple bars, pie charts, histogram.	12
III	Creating sequences, partial sums. Creating a matrix, basic operations in a matrix, determinant, inverse of a matrix, solution to a system of equations using matrix.	12
IV	Measures of central tendency, mean, median and mode, quartiles, percentiles, measures of dispersion, range, variance and standard deviation	12
V	Measures of skewness and kurtosis, exploratory data analysis, stem and leaf diagram and box plot.	12
	References: 1. J. H. Weber and et al., Getting started with Libre Office 7.0, 2021 https://documentation.libreoffice.org/en/ 2. J. D. Miller, Statistics for Data Science, Packt Publishing Ltd., 2017.

CO5	0	1	1	0	1	1	0	1

Semester III

Subject Code: MAT1031 **Credits: 4**

Differential and Integral Calculus

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concepts of derivatives and integration	Remember/ Understand
CO 2	solve problems on differentiation and integration in two and three dimensional spaces	Apply
CO 3	examine the local extremum, concavity, convexity of functions and the order of integration	Analyze
CO 4	determine tangent of a curve, area, arc length, volume and, evaluate double and triple integrals	Evaluate
CO 5	compile the application of derivatives, Beta and Gamma functions	Create

Syllabus

Units	Content	Hrs.
I	(Review of differential calculus), related rate problems, implicit differentiation, tangent of a curve (given in parametric form and in implicit form), motion on a straight line, local extremum, increasing, decreasing functions.	12
II	Envelopes, curvature, circle, radius and centre of curvature, formula for the radius of curvature when the curve is given in Cartesian and polar co-ordinates, cartesian co-ordinates of the centre of curvature, evolute and involute, p-r equations of curves.	12
III	Higher order derivatives, Taylor's series expansion of sin x, cos x, e^x, log(1 + x), $(1 + x)^m$ (with m is a negative integer or a rational number), Leibnitz rule and its applications to problems of type e^{ax+b} sin x, e^{ax+b} cos x, $(ax + b)^n$ sin x, and $(ax + b)^n$ cos x, convex and concave functions, curve tracing.	12
IV	(Review of integral calculus: Area under curves, applications of integrals to find area, reduction formulae for powers of trigonometric functions), differentiation under integral sign by Leibnitz rule, line integrals, double integrals, change of order of integration, double integrals in polar form, Jacobian determinant, change of variables.	12
V	Gamma function and Beta function, relation between beta and gamma integrals.	12

Scientific Computing Lab

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	use Python and SageMath's built-in commands/functions in a Jupyter notebook.	Remember / Understand
CO 2	define functions and run several numerical methods in SageMath.	Apply
CO 3	create and manipulate data structures like lists anddictionaries in SageMath.	Analyze
CO 4	visualize graphs and other objects in two and three dimensions in SageMath.	Evaluate
CO 5	perform basic statistical analysis of a given data using SageMath.	Create

Syllabus

Units	Content	Hrs.
I	Review of Python commands, Python variables, symbolic variables, first computations, elementary functions and usual constants, auto completion, simple plotting, symbolic expressions and simplification, transforming expressions, usual mathematical functions, assumptions and pitfalls, explicit solving of equations, equation with no explicit solution, sums, limits, sequences, power series expansions, series, derivatives, partial derivatives, integrals, solving linear systems, vector computations, matrix computations, reduction of a square matrix.	12
II	Programming with Sage, Python language keywords, Sage keywords, special symbols in Sage and their uses, function calls, algorithms, loops, approximation of sequence limits, conditionals, procedures and functions, iterative and recursive methods, input and output	12
III	Lists and other data structures, list creation and access, global list operations, main methods on lists, examples of list manipulations, character strings, shared or duplicated data structures, mutable and immutable data structures, finite sets, dictionaries,	12
IV	2D graphics graphical representation of a function, parametric curve, curves in polar coordinates, curve defined by an implicit function, data plot, displaying solutions of differential equations, evolute of a curve, 3D graphics	12
V	Statistics with SageMath: Basic functions random, mean, median, mode, moving average, std, variance, C Int Stats, stats.IntList, min, max, plot, histogram, product, sum, distributions, norm, uniform, expon, Bernoulli, Poisson, statistical functions, stats.gmean, stats.hmean, stats.skew, stats.histogram2, stats.kurtosis, stats.linregress, statistical model, linear fit, stats.glm.	12

Abstract Algebra

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the basic concept groups, subgroups, rings, integral domain, fields and ideals	Remember / Understand
CO 2	solve problems using properties of groups and rings	Apply
CO 3	examine the converse part of Lagrange's theorem and characterization of fields	Analyze
CO 4	find the irreducible polynomial over the field of rational numbers and given an ideal is maximal or not in a commutative ring.	Evaluate
CO 5	investigate the given natural number can be written as the product of prime factors (unique up to isomorphism)	Create

Syllabus

Units	Content	Hrs.
I	Groups, definition and examples, finite, infinite, abelian, cyclic groups, Subgroups, existence of smallest subgroups of a group containing a subset of the group, order of an element, cosets of subgroups, Lagrange's theorem.	12
II	Normal subgroups, properties, the subgroup of the form HK and O(HK), quotient groups, homomorphisms of groups, kernel, image, fundamental theorem of homomorphism.	12
III	Permutation groups, Cayley's theorem, automorphisms.	12
IV	Rings, commutative ring, integral domain, division ring, field (definitions), finite integral domain is a field, ring homomorphism, ideals, quotient rings, maximal ideals and prime ideals and their characterizations, quotient field of an integral domain.	12
V	Euclidean rings: division algorithm, GCD and unique factorization theorem in a Euclidean ring, principal ideal domain and unique factorization domain, polynomial rings.	12

Sequences and Series

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the definitions of sequences, series, limit, infimum and supremum	Remember / Understand
CO 2	examine the convergence and divergence of sequences and series using various tests	Apply
CO 3	be familiar with the properties of various types of sequences, series and Archimedean property	Analyze
CO 4	find the limits of convergent sequences and convergent series	Evaluate
CO 5	investigate the infimum, supremum, limit infimum and limit supremum	Create

Syllabus

Units	Content	Hrs.
I	Infimum and supremum, least upper bound property, Archimedean property in R, Q is dense in R, existence of n^{th} root of unity (without proof).	9
II	Sequences of real numbers, definition of a sequence and subsequence, limit of a sequence, the algebra of limits, convergent sequences and their properties, divergent sequences, oscillating sequence.	9
III	Bounded sequences, monotone sequences, behavior of monotonic sequences.	9
IV	Operations on convergent sequences, operations on divergent sequences, limit supremum and limit infimum, Cauchy sequences.	9
V	Series of real numbers, convergence and divergence, series with non-negative terms, alternating series, tests for convergence of series.	9

Vector Analysis

Course Outcomes (CO)

On completion of the course the student will be able to

	Course Outcome	Level
CO1	understand the concepts of vectors, derivatives and integration.	Remember / Understand
CO2	solve problems on vector differentiation and integration in two and three dimensional spaces.	Apply
CO3	examine the extreme values of functions of two variables, solenoidality, irrotationality, conservativeness of a given vector field and verify Gauss, Green's and Stokes theorems.	Analyze
CO4	determine Hessian matrix, area, arc length, surface area and volume of surface of revolution, and evaluate double and triple integrals.	Evaluate
CO5	compile the application of line, surface and volume integrals.	Create

Syllabus

Units	Content	Hrs.
I	Differentiability, total differential, chain rule. directional derivative, gradient of a scalar field, geometrical meaning, tangent plane, Hessian matrix, extreme values and saddle point for function of two variables.	9
II	Operations with vectors, scalar-valued functions over the plane and the space, vector function of a scalar variable, divergence and curl of a vector field, solenoidal field, irrotational field and conservative field, scalar and vector potentials.	9
III	Laplacian of a scalar field, standard identities involving curl, divergence, gradient and Laplacian operators.	9
IV	Line integral, surface integral, surface area, applications.	9
V	Volume Integral, volumes of surface of revolution, triple integrals in rectangular, cylindrical and spherical coordinates.	9

Foundation Course in Mathematics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the definitions of a statement, sets and functions.	Remember / Understand
CO 2	apply the understanding to negate the statements and write logical proofs	Apply
CO 3	understand by analysis the subtleties of counterexamples and proofs by contradiction	Analyze
CO 4	evaluate the various concepts learned in the context mathematical concepts	Evaluate
CO 5	observe patterns from examples and write it as a statement and prove it with logical arguments.	Create

Syllabus

Units	Content	Hrs.
I	Statements and Logic: Quantifiers, statements with single quantifiers, negation of a statement, statement with multiple quantifiers, compound statements, proofs in mathematics.	6
II	Sets: Writing sets in roster form vs set-builder form, operation on sets, family of sets, cartesian product of sets.	6
III	Functions: Definitions, one-one, onto and bijective functions, composition of functions, inverse of a function, image and inverse image of subsets under functions. Relations on sets, types of relations, functions as relations, equivalence relations, equivalence classes and partitions of a set.	6
IV	Countability of sets: Sets with same cardinality, Schroder-Bernstein theorem, finite sets, countable sets and comparing cardinality. induction principle(s), the well-ordering principle, equivalence of the above statements.	6
V	Partial and total orders, chains, bounds and maximal elements, axiom of choice and its equivalents.	6

Linear Algebra

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concepts of vector spaces, subspaces and linear transformations	Remember /Understand
CO 2	appreciate the geometry of vector spaces using parallelogram law, Pythagorean theorem and triangle inequality	Apply
CO 3	know the relation between matrices and linear transformations	Analyze
CO 4	know the concepts of diagonalization, Jordan form and rational canonical form	Evaluate
CO 5	know the difference between various kind of operators like self-adjoint operators, normal operators etc.	Create

Syllabus

Units	Content	Hrs.
I	Vector spaces, subspaces, examples, algebra of subspaces, quotient spaces, linear combination of vectors, linear span, linear independence, basis and dimension, dimension of subspaces.	12
II	Linear transformations, null space, range, rank and nullity of a linear transformation, matrix representation of a linear transformation, algebra of linear transformations. Isomorphisms, isomorphism theorems, invertibility and isomorphisms, change of coordinate matrix.	12
III	Dual spaces, dual basis, double dual, transpose of a linear transformation and its matrix in the dual basis, annihilators.	12
IV	Eigen spaces of a linear operator, diagonalizability, invariant subspaces and Cayley-Hamilton theorem, the minimal polynomial for a linear operator.	12
V	Inner products and norms, Gram Schmidt orthogonalization process, orthogonal complements.	12

Real Analysis

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	learn and understand the definitions of open set, closed set, continuous functions, integrable functions, differentiable functions, connected and compact metric spaces and convergence of sequence of functions.	Remember / Understand
CO 2	find elementary examples and obtain the elementary results on the various kinds of sets, functions and spaces.	Apply
CO 3	learn the detailed proofs of the simple theorems on metric spaces, continuous functions, differentiable functions, integrable functions and convergence of sequence of functions.	Analyze
CO 4	solve problems on these topics in real analysis	Evaluate
CO 5	providing non-trivial examples and counter examples in real analysis and to provide the proofs of the moderate theorems under graduate level.	Create

Syllabus

Units	Content	Hrs.
I	Metric space, continuous functions on metric spaces, open sets, closed sets, interior, closure, discontinuous function on R, connectedness, completeness and compactness, more about open sets, connected sets.	12
II	Bounded sets and totally bounded sets, complete metric spaces, compact metric spaces, continuous functions on a compact metric space, continuity of inverse functions, uniform continuity.	12
III	Definition of the Riemann integral, existence of the Riemann integral, properties of Riemann integral.	12
IV	Derivatives, Rolle's theorem, law of mean, fundamental theorems of calculus, Taylor's theorem.	12
V	Point wise convergence of sequences of functions, uniform convergence of sequences of functions.	12

Optimization Techniques

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the history, properties and principles of operations research and linear programming.	Remember/ Understand
CO 2	improve the problems solving skills related to the scientific methods of operations research.	Apply
CO 3	learn the modeling and solutions of linear programming problem	Analyze
CO 4	model the assignment and transportation problems and their methods of solutions.	Evaluate
CO 5	model the real-life sequencing problems, theoretical models and their solutions	Create

Syllabus

Units	Content	Hrs
I	The linear programming problem: Problem formulation, graphical method, definitions of bounded, unbounded and optimal solutions, linear programming in matrix notation, definitions of basic, non-basic variables, basic solutions, slack variables, surplus variables and optimal solution, simplex method of solution of a linear programming problem, big M-technique.	12
II	Two phase simplex method, degeneracy and cycling, revised simplex method, duality theory, formulation of dual problem, duality theorems, primal dual method, dual simplex method, sensitivity analysis.	12
III	Balanced and unbalanced transportation problems, feasible solution, basic feasible solution, optimum solution, degeneracy in a transportation problem, mathematical formulation, North West Corner rule, Vogel's approximation method, method of matrix minima, algorithm of optimality test.	12
IV	Balanced and unbalanced assignment problems, restrictions on assignment problem, mathematical formulation, formulation and solution of an assignment problem (Hungarian method), degeneracy in an assignment problem.	12
V	Sequencing problem, n jobs through 2 machines, n jobs through 3 machines, two jobs through m machines, n jobs through m machines. Definition of network, event, activity, critical path, total float and free float, difference between CPM and PERT, problems.	12

Statics and Dynamics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	state basic concepts and principles of statics and dynamics of particles in two and three dimensions	Remember / Understand
CO 2	apply Newtonian mechanics to model and predict the responses of simple dynamical system (particle and rigid body) subjected to applied forces	Apply
CO 3	identify the equilibrium for different mechanical systems	Analyze
CO 4	develop problem solving skills in mechanics through the application of concepts in statics and dynamics to complex problems	Evaluate
CO 5	construct simple mechanical system	Create

Syllabus

Units	Content	Hrs.
I	Newton's laws of motion, resultant of two forces on a particle, equilibrium of a particle, limiting equilibrium of a particle on an inclined plane.	12
II	Moment of a force, general motion of a body, equivalent systems of forces, parallel forces, forces acting along a triangle, a specific reduction of forces, reduction of coplanar forces into a force and couple, problems involving frictional forces.	12
III	Work, conservative field of force, power, rectilinear motion under varying force, simple harmonic motion along a horizontal line and along a vertical line.	12
IV	Forces on a projectile, time of flight, range on an inclined plane.	12
V	Impulses, fundamental laws of impact, impact of a smooth sphere on a fixed smooth plane, direct and oblique impact, loss of kinetic energy due to impact. general orbits, central orbit, conic as a centered orbit.	12

Mathematical Modelling

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	recognize the relationship between real-life problems and mathematics	Remember/ Understand
CO 2	apply various models using difference and differential equations in terms of linear growth, decay models and etc.	Apply
CO 3	analyze the characteristics and limitations of mathematical modelling.	Analyze
CO 4	make predictions of the behavior of a given system based on the analysis of its mathematical model.	Evaluate
CO 5	construct mathematical models related to the current situation in epidemics, economics, etc.	Create

Syllabus

Units	Content	Hrs.
I	Mathematical Modelling: Simple situations requiring mathematical modelling, techniques of mathematical modelling, characteristics of mathematical models, limitation of mathematical modelling, mathematical models through geometry, algebra, trigonometry and calculus.	12
II	Mathematical modelling through differential equations: Linear growth and decay models. non-linear growth and decay models, compartment models.	12
III	Mathematical modelling through system of ordinary differential equations of first order: Mathematical modelling in population dynamics, mathematical models of epidemics, economics and medicine.	12
IV	Mathematical modeling through ordinary differential equations of the second order: Mathematical modeling of planetary motions, mathematical modeling of circular motion and motion of satellites, mathematical modeling through linear differential equations of the second order, miscellaneous mathematical models through ordinary differential equations of the second order	12
V	Mathematical modelling through difference equations: Basic theory of linear difference equations with constant coefficients, mathematical modelling through difference equation in economics, finance, population dynamics	12

Differential Equations

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	gain motivation and understandings towards the origin of ordinary differential equations, properties and solutions of first order ordinary differential equations	Remember/ Understand
CO 2	apply various methods in finding the solution spaces of ordinary differential equations, partial differential equations and Laplace transforms.	Apply
CO 3	analyze of the properties of the ordinary differential equations, partial differential equations and Laplace transforms.	Analyze
CO 4	obtain the solutions of first and 2^{nd} order ordinary differential equations, partial differential equations using the existing methods in the syllabus.	Evaluate
CO 5	discuss about the types of solutions and the application of Laplace transform method for the given differential equations.	Create

Syllabus

Units	Content	Hrs
I	Ordinary Differential Equations - First order: Exact equations, integrating factors (theory and problems), orthogonal trajectories. Second order ordinary differential equations with constant coefficients (theory and problems): Homogeneous, solution space. Non-homogeneous, complimentary solution and particular solutions, method of variation of parameters.	12
II	Laplace transform: Laplace transforms of standard functions, properties of Laplace transforms, inverse Laplace transform and its properties. Dirac delta function, convolution integral. applications of Laplace transform in solving linear ordinary differential equations with constant coefficients, ordinary differential equations with discontinuous right-hand sides.	12
III	Partial differential equations: Introduction, formation of partial differential equations, Theory and problems on first order partial differential equations, classification of integrals, Lagrange's method, Pfaffian differential equations, Charpit's method. Homogeneous and non homogeneous linear partial differential equations with constant coefficients: Higher order.	12
IV	Fourier Series, half range series, applications to boundary value problems - vibration of strings, one dimensional heat equation, steady state two dimensional heat equations.	12
V	Fourier transform and its properties, applications of Fourier transform to partial differential equations.	12

Complex Analysis

Course Outcomes (CO)

On completion of the course the student will be able to

	Course Outcome	Level
CO1	learn and understand the basics of analytic functions.	Remember / Understand
CO2	solve problems using Cauchy's integral formula and Cauchy's residue theorem	Apply
CO3	check the analyticity of a given function, apply C-R equations to find the harmonic conjugate, find the radius of convergence of a power series.	Analyze
CO4	compute Laurent series expansion and classify the types of singularities, the number of zeroes of a polynomial in an annulus with centre zero.	Evaluate
CO5	find a linear fractional transform with a given values at three specific points, cross ratios, and to check if the given three points are on a line or a circle	Create

Syllabus

Units	Content	Hrs.
I	(Quick Review: Complex numbers and geometrical representations, Cauchy-Schwarz inequality principal argument of a complex number, nth root of a complex number), sequences and series of complex numbers, limit and continuity of complex valued functions of a complex variable, extended complex numbers and stereographic projection.	12
II	Complex and partial differentiability, Cauchy-Riemann equations, karmonic function, harmonic conjugate, problems on finding harmonic conjugates, finding analytic functions from a given harmonic function as its real (or imaginary) part.	12
III	Radius of convergence of a power series, differentiability and uniqueness of power series, problems on finding radius of convergence of power series, polynomial and rational functions, Lucas' theorem, existence of partial fraction expansion of rational functions, linear fractional transforms / Mobius transforms, Mobius transform maps circles and lines to circles and lines, cross ratios, symmetric points with respect to circle or straight line, divergence, gradient and Laplacian operators.	12
IV	Piece-wise smooth curve, line Integrals and their properties, Cauchy's theorem (without proof), Cauchy's integral formula, evaluation of integrals using Cauchy's integral formula (problems only), types of singularities, characterization of removable singularity, Taylor's theorem, Laurent series (without proof), zeros, poles and singularities, problems on expanding Laurent series, characterization of singularities using Laurent series.	12
V	Residue definition, problems on finding residues of functions at isolated singularities, Cauchy's residue theorem (without proof), Evaluation of integrals using Cauchy's residue theorem- Evaluation of real integrals (problems only), evaluating number of zeroes of polynomials using Rouche's theorem.	12

Graph Theory

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concept of graphs, subgraphs and graph isomorphisms	Remember / Understand
CO 2	demonstrate Cayleys's formula to count the spanning trees of K_n	Apply
CO 3	distinguish between connectivity and edge connectivity, between vertex coloring and edge coloring	Analyze
CO 4	determine Eulerian graphs, planar graphs and chromatic polynomial of a given graph	Evaluate
CO 5	translate real-world problems in to graph theoretic models	Create

Syllabus

Units	Content	Hrs.
I	Graphs, subgraphs, isomorphism of graphs, degrees of vertices, paths and connectedness, trees, counting the number of spanning trees and Cayley's Formula.	12
II	Vertex cuts, edge cuts, connectivity, edge-connectivity, blocks and Eulerian graphs.	12
III	Hamilton graphs, necessary conditions, Dirac's theorem, closure of a graph - a criterion for Hamilton graphs using closure of a graph and Chvatal's theorem.	12
IV	Edge colourings, vertex colourings, critical graph, properties of critical graphs and chromatic polynomials.	12
V	Planar and nonplanar graphs, Euler's Formula and its consequences, K_5 and $K_{3,3}$ are nonplanar graphs, dual of a plane graph, the Four-Color Theorem (without proof) and the Heawood Five-Color Theorem and Kuratowski's Theorem (without proof).	12

Numerical Analysis

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	demonstrate the theory about polynomials and accuracy about numerical methods.	Remember/ Understand
CO 2	solve algebraic and transcendental equations and study the rate of convergence	Apply
CO 3	analyze the properties about polynomials to develop methods to perform integration and differentiations.	Analyze
CO 4	evaluate numerically the approximate solution of ordinary differential equations	Evaluate
CO 5	formulate numerical procedure when real world problems are modelled by the system and understand how the iteration gives approximate solution to the system.	Create

Syllabus

Units	Content	Hrs.
I	Introduction to error analysis, algebraic and transcendental equations: Bisection method, iteration method, Regula-Falsi method, secant method, Newton-Raphson's method, error analysis, rate of convergence.	12
II	System of Equations: Linear system (Direct methods): Gauss elimination, pivoting strategies, vector and matrix norms, error estimates and condition number, LU decomposition. Linear system (Iterative methods): Gauss-Jacobi and Gauss-Seidel Convergence analysis, eigenvalue problem, power method, Jacobi for a real symmetric matrix.	12
III	Interpolation: Lagrange's interpolation, error analysis, Newton's divided differences, Newton's finite difference interpolation, optimal points for interpolation, Piecewise polynomial interpolation: Piecewise linear and spline interpolation	12
IV	Numerical differentiation and Integration: Numerical differentiation based on interpolation, finite differences. Numerical integration: Newton Cotes formulae, Gaussian quadrature, Trapezoidal and Simpson's rules, error analysis. Quadrature rules for multiple integrals.	12
V	Ordinary differential equations: Single-step methods, Euler's method and Modified Euler's method, Taylor series method, Runge-Kutta method of fourth order, Multistep methods: Adams-Bashforth -Moulton methods, stability analysis, Boundary value problems: Finite Difference method.	12

Statistics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	quantify the uncertainness in various real-life situations using the knowledge of probability.	Remember / Understand
CO 2	model and predict various events as discrete random variables.	Apply
CO 3	model and predict various events as continuous random variables.	Analyze
CO 4	estimate the basic statistics in a practical situation and to give a conclusive inference from the available resources.	Evaluate
CO 5	test different hypothesis and to establish the validity of the proposed hypothesis with statistical evidence.	Create

Syllabus

Units	Content	Hrs.
I	Descriptive statistics scientific investigation, population and sample, data collection, types of variables and scales of measurement, methods of displaying data, graphical and tabular methods, grouped data, frequency distributions, histograms and frequency polygons, measures of central tendency: mean, median and mode, quantiles: quartiles, percentiles, measures of dispersion, range, variance and standard deviation, measures of skewness and kurtosis, exploratory data analysis, stem and leaf diagram and box plot. bivariate data, scatter plot, covariance and correlation coefficient, applications.	12
II	Point estimation and confidence intervals point estimation of the population mean and standard deviation of a normal distribution, estimation of proportion, confidence intervals, large sample methods, applications.	12
III	Hypothesis - simple and composite, null and alternative, test of hypothesis, Type I and Type II errors, level and power of a test, p-value, tests for mean and standard deviation, test for proportion, one tail or two tails. applications.	12
IV	Comparison of two populations, paired-observation comparisons, difference between (a) population means and (b) population proportions using independent random samples, equality of population variances, large sample tests, applications.	12
V	Designed experiments completely randomized, randomized complete blocks and Latin square experiments, analysis of variance, Introduction to multifactor experiments, applications.	12

Numerical Analysis - Lab

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	remember program for simple arithmetic operations with scalars, vectors and matrices.	Remember/ Understand
CO 2	implement computer program to solve algebraic and transcendental equations	Apply
CO 3	test the problem by producing two-dimensional and three-dimensional plots	Analyze
CO 4	select computer algorithm to solve differential equations	Evaluate
CO 5	develop a computer algorithm to analyze the consistency, stability and convergence of a numerical methods.	Create

Syllabus

Units	Content	Hrs.
	Laboratory Assignments (not limited to): 1. To find the roots of the Algebraic and Transcendental equations using Bisection method, Regula-Falsi method, Newton-Raphson method, Secant method and Iterative method 2. To solve the system of linear equations using Gauss elimination method, Gauss Jacobi method, Gauss-Seidal method and Gauss Jordan method 3. To determine the Eigen values and Eigen vectors of a Square matrix. 4. To find the largest eigenvalue of a matrix by power method. 5. To implement Numerical Integration using Trapezoidal rule. 6. To implement Numerical Integration using Simpson 1/3 rule. 7. To implement Numerical Integration Simpson 3/8 rule 8. To implement Newton's Forward/Backward Interpolation formula 9. To implement Gauss Forward/Backward Interpolation formula 10. To implement Newton's Divided Difference formula 11. To implement Langrange's Interpolation formula 12. To find numerical solution of ordinary differential equations by Euler's method, Runge-Kutta method and Adams-Bashforth method	60

Groups and Rings

Course Outcome (CO)
On completion of the course the students will be able to

	Course Outcome	Level
CO 1	have a thorough introduction to the subject	Remember/ Understand
CO 2	appreciate Sylow's theorems and its applications	Apply
CO 3	solve problems on conjugacy classes, Sylow's theory, field extensions and solvable groups	Analyze
CO 4	apply the results in other branches of mathematics in particular number theory	Evaluate
CO 5	have a detailed knowledge on ring, ideal, Noetherian and Artinian ring.	Create

Syllabus

Units	Content	Hrs.
I	Conjugacy classes, class equations, Cauchy's theorem for abelian groups, Sylow's theorem for abelian groups, Cauchy's theorem, number of conjugacy classes in S_n, conjugate of a subgroup.	12
II	Sylow's theorem, three parts of Sylow's theorem, applications of Sylow' theorem, Structure theorem for finite abelian groups (without proof). Composition series, Jordan-Holder theorem.	12
III	Semidirect product, nilpotent group, solvable group, group action, p-groups	12
IV	Rings, ideals, maximal ideals, prime ideals, nilradical, Jacobson radical.	12
V	Chain, ascending chain condition, descending chain condition, Noetherian ring, Artinian Ring.	12

Analysis

Course Outcome (CO)

On completion of the course the students will be able to

	Course outcome	Level
CO 1	learn and understand the basics of topological properties of metric spaces and convergent sequences, Cauchy sequences, convergence and absolute convergence of series, limit, continuity, differentiability and Rieman-Stieltjes integrability.	Remember/ Understand
CO 2	find or check the topological properties of the given sets, limit, continuity and differentiability of given functions, convergence of given sequences and series, and proof simple results on these topics.	Apply
CO 3	learn the detailed proofs of moderate results on the keywords mentioned above	Analyze
CO 4	learn the proofs of theorems on equivalence of compact sets, and theorems on connectedness and perfect sets, mean-value theorem, Taylor's theorem, various theorems on Riemann-Stieljes integrable functions.	Evaluate
CO 5	provide non-trivial examples and counter examples on Analysis, and learn the proofs of challenging theorems such as Heine-Borel theorem, L'Hospital's rule, and some big theorems on the other topics.	Create

Syllabus

Units	Content	Hrs.
I	(Recall Convergent series, examples, series of non-negative terms). The number e, rearrangements of series, Riemann theorem (without proof). Metric space, interior point, limit point, perfect set, Cantor set, Bolzano's theorem, Heine Borel theorem, Subsequential limits, limit infimum and limit supremum, and their properties.	12
II	Limits of functions between metric spaces, continuous functions, uniformly continuous functions, examples of continuous but not uniformly continuous functions, continuity and compactness, continuity and connectedness, discontinuities, monotone functions, infinite limits and limit at infinity.	12
III	Differentiable functions, local extremums, mean-value theorems, continuity of derivatives, L'Hospital's rule, Derivatives of higher order and Taylor's theorem, derivatives of vector valued functions.	12
IV	Riemann integration, Riemann - Stieltjes integration: the definition of the Riemann - Stieltjes integral, linear properties, integration by parts, change of variable in a Riemann - Stieltjes integral, reduction to a Riemann integral, Euler's summation formula, monotonically increasing integrators, upper and lower integrals, additive and linearity properties of upper, lower integrals, Riemann's condition, comparison theorems.	12
V	Integrators of bounded variation, sufficient conditions for the existence of Riemann-Stieltjes integrals, necessary conditions for the existence of Riemann-Stieltjes integrals, mean value theorems, integrals as a function of the interval, Second fundamental theorem of integral calculus, change of variable, second mean value theorem for Riemann integral, Riemann-Stieltjes integrals depending on a parameter, differentiation under integral sign, Lebesgue criterion for existence of Riemann integrals.	12

Advanced Linear Algebra

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concepts of vector spaces, subspaces and linear transformations	Remember/ Understand
CO 2	appreciate the geometry of vector spaces using parallelogram law, Pythagorean theorem and triangle inequality	Apply
CO 3	know the relation between matrices and linear transformations	Analyze
CO 4	know the concepts of diagonalization, Jordan form and rational canonical form	Evaluate
CO 5	know the difference between various kind of modules like free, quotient and finitely generated modules and construct orthonormal space	Create

Syllabus

Units	Content	Hrs.
I	(Recall: Vector spaces and its properties, span and linear independence, bases, dimension), linear maps, null spaces and ranges, rank-nullity theorem, matrix of a linear map, invertibility, review of polynomials with complex and real coefficients, eigenvalues and eigenvectors, existence of eigenvalue, triangularization and diagonalization of linear transformations, invariant subspaces.	12
II	Inner-product spaces, Pythagorean theorem, triangle inequality, parallelogram law, orthonormal basis, Gram-Schmidt process, orthogonal projections and its properties, skew-symmetric transformations. linear functionals and hyperplanes, orthogonal transformations, definition of adjoint operator and its properties.	12
III	Operators on complex vector spaces, generalized eigenvectors, characteristic polynomial and Cayley Hamilton theorem, minimal polynomial, Jordan decomposition, Jordan form, rational canonical form.	12
IV	Modules, motivation to module theory, various rings and its importance, examples, comparison of modules and vector spaces, submodules, spanning set, linear independence, free modules.	12
V	Module homomorphism, quotient modules, isomorphism theorems, operations on submodules, direct sum, finitely generated modules. Noetherian modules.	12

Advanced Complex Analysis

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concepts of complex integration, series expansion of a meromorphic function, infinite product expansion of an entire functions.	Remember/ Understand
CO 2	solve problems on complex integration.	Apply
CO 3	examine the proofs of Cauchy's theorems for rectangle for disc, Cauchy's integral formula.	Analyze
CO 4	discuss the proofs of Morera's theorem, Liouville's theorem, fundamental theorem of algebra.	Evaluate
CO 5	find the complex integrals, infinite sums and series using the Cauchy's residue theorem, Weierstrass theorem and Mittag-Leffler theorem.	Create

Syllabus

Units	Content	Hrs.
I	Quick review of complex derivative, partial derivative, C-R equations, power series. branch of log and some other functions, Cauchy's theorem for rectangle, rectangle theorem with exceptional points, exact differentiable form, Cauchy's theorem for disc, winding number, Cauchy's theorem for disc with exceptional points, Cauchy's integral formula, higher order derivatives.	12
II	Morera's theorem, Liouville's theorem, fundamental theorem of algebra, Removable singularities, Taylor's theorem, zeroes and poles, essential singularity, algebraic order of isolated singularity, local correspondence theorem, open mapping theorem, maximum modulus principle.	12
III	Simply connected region, Cauchy's theorem for simply connected region, homology, Cauchy's theorem for multiply connected region, residues, Argument principle, Rouche's theorem, evaluation of definite integrals (theory with proof).	12
IV	Harmonic function, mean-value property of harmonic function, Poisson's formula, Schwartz theorem, Reflection principle, Weierstrass theorem, Taylor's series and Laurent's series.	12
V	Partial fractions, Mittag-Leffler theorem, expansion of $\pi/\sin\pi z$, infinite products, canonical products, Gamma function, infinite product expressions for $\pi\cot\pi z$ and $\sin\pi z$, Jensen's formula, Poisson-Jensen's formula.	12

Ordinary Differential Equations

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	recognize the relation between linear algebra, analysis and differential equations	Remember/ Understand
CO 2	apply various methods to solve ordinary differential equations	Apply
CO 3	analyze the qualitative properties of solutions of differential equations	Analyze
CO 4	evaluate the solutions using separation of variables and Fourier series	Evaluate
CO 5	develop a method to distinguish singular and ordinary points in the higher order ordinary differential equations	Create

Syllabus

Units	Content	Hrs.
I	First-order differential equations, existence and uniqueness theorem, Picard's iteration (Theory and problems). second-order Linear equations with variable coefficients, reduction of order, Wronskian theory and linear dependence, non-homogeneous equations: method of variations of parameters (Theory and problems), method of judicious guessing (or method of undetermined coefficients).	12
II	Series solution: singular points, Euler equation, regular singular points - the method of Frobenius, Equal roots, and roots differing by an integer: Bessel equation, Legendre equation, Laguerre equation, Hermite equation, Chebschev equations, higher order equations.	12
III	System of differential equations: Algebraic properties of solutions of linear systemsm the eigenvalue-eigenvector method of finding solutions, complex roots, equal roots, fundamental matrix solutions, the non-homogeneous equations, variation of parameters, method of judicious guessing.	14
IV	Qualitative theory: Stability of linear system of ordinary differential equations, stability of equilibrium solutions, the phase-plane	12
V	Self-adjoint eigenvalue problems: Sturm-Liouville systems, eigenvalues and eigenfunctions, eigenfunction expansions	10

Discrete Mathematics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	**Level**
CO 1	understand recurrence relations, formal languages and grammars	Remember/ Understand
CO 2	understand symbolic logic, posets and lattices	Apply
CO 3	understand Boolean algebra	Analyze
CO 4	apply Boolean Algebra to switching theory	Evaluate
CO 5	understand finite state machines	Create

Syllabus

Units	**Content**	**Hrs.**
I	Partially ordered sets (posets), Hasse diagram of partially ordered sets, linear orders, linear extension of a partially ordered set, realizer and dimension of a poset.	9
II	Mathematical induction, strong induction and well ordering principle, recurrence relations and generating functions, some number sequences, linear homogeneous recurrence relations, non-homogeneous recurrence relations, generating functions, recurrences and generating functions, exponential generating functions.	9
III	Lattices as partially ordered sets, their properties, lattices as algebraic systems. sub lattices, direct products and homomorphism, some special lattices e.g. complete, complemented and distributive lattices.	9
IV	Boolean algebras as lattices, various Boolean identities, the switching algebra. example, subalgebras, direct products and homomorphism, joint-irreducible elements, atoms and minterms, Boolean forms and their equivalence, minterm Boolean forms, sum of products, canonical forms, minimization of Boolean functions, applications of Boolean algebra to switching theory (using and, or and not gates.) the Karnaugh method.	9
V	Finite state machines and their transition table diagrams, equivalence of finite state, machines, reduced machines, homomorphism, finite automata, acceptors, non-deterministic, finite automata and equivalence of its power to that of deterministic finite automata, Moore and Mealy machines.	9

Advanced LaTeX

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand packages, environment used in LATEX	Remember / Understand
CO 2	prepare report, paper and articles on their own	Apply
CO 3	distinguish between images and graphics	Analyze
CO 4	apply different packages to generate new document	Evaluate
CO 5	understand Finite state machines	Create

Syllabus

Units	Content	Hrs.
I	Recall basic LaTeX - invoking AMS LaTeX, standard features of AMS LaTeX, further AMS LaTeX packages, AMS fonts, other packages.	6
II	Preparation of research articles, project reports/thesis, slides, books, etc.	6
III	BibTEX program, creating, bibliographic data base, customizing bibliographic styles.	6
IV	Picture environment in LATEX, drawing packages, inserting images, graphics packages, adding color.	6
V	Structure of error messages, some sample errors, Warnings.	6

Field Theory

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concepts of field, Galois theory and solvable by radicals.	Remember / Understand
CO 2	appreciate spitting field, Galois theory, finite fields and their applications	Apply
CO 3	solve problems on roots of polynomials, Galois theory, field extensions and solvability by radicals	Analyze
CO 4	Find the dimension of the constructed extension fields	Evaluate
CO 5	have a detailed knowledge on Galois theory	Create

Syllabus

Units	Content	Hrs.
I	Fields, Field extensions, finite extension, algebraic extension, roots of polynomials, splitting field.	12
II	More about roots, simple extension, splitting field of a polynomial, Galois theory, Galois group, fixed field, theorem on symmetric polynomials, normal extension.	12
III	Fundamental theorem of Galois theory, ruler and compass construction, Abel's theorem.	12
IV	Finite fields, Wedderburn's theorem on finite division rings.	12
V	Solvability by radicals, a theorem of Frobenius, integral quaternions and the four-square theorem.	12

Topology

Course Outcome (CO)

On completion of the course the students will be able to

	Course outcome	Level
CO 1	understand the concepts of topology, basis, subbasis, subspace topology, open set, closed set, interior, closure, continuous function, homeomorphism, open map and quotient map.	Remember/ Understand
CO 2	find the applications of topology.	Apply
CO 3	identify the differences among the various separation axioms	Analyze
CO 4	discuss the proofs Urysohn's lemma, Tietze's extension theorem, Urysohn's metrization theorem, Tychnoff's theorem	Evaluate
CO 5	construct examples and counter examples of various topological properties	Create

Syllabus

Units	Content	Hrs.
I	Topological space definitions and examples, basis and subbasis, order topology, continuous functions, product topology, subspace topology, closed sets, closures, limit points, cluster (accumulation) points, interior and boundary of a set, metric topology, quotient topology.	12
II	Connectedness, components, locally connectedness, and path-connectedness and locally path-connectedness.	12
III	Compactness, tube lemma, compact subspaces of real line, characterization of compact metric spaces, locally compactness.	12
IV	Countability axioms, $T1$-spaces, Hausdorff spaces, regular spaces, completely regular spaces, Normal spaces, one-point compactification, Uryosohn's lemma and Tietze extension theorem.	12
V	Urysohn Metrization Theorem, Tychonoff's theorem, Stone-Cech ˇ Compactification (statement only).	12

Measure and Integration

Course Outcome (CO)

On completion of the course the students will be able to

	Course outcome	Level
CO1	understand the definition of outer measure, measurable sets and measurable functions, Lebesgue integrals of different types of functions, abstract measure on a measurable space and signed measure.	Remember / Understand
CO2	learn simple examples and proofs of simple theorems on these topics.	Apply
CO3	learn the proofs of moderate theorems on measurable sets, measurable functions, abstract measure spaces and signs measures.	Analyze
CO4	discuss the proofs of every interval is measurable, Fatou's lemma, monotone convergence theorem, dominated convergence theorem, Hahn decomposition theorem, Jordan decomposition theorem, Holder's and Minkowski's inequalities, and other moderate theorems on these topics.	Evaluate
CO5	provide challenging examples and counterexamples such as non measurable sets, measurable but not a Borel set, and learn the detailed proofs of various challenging theorems such as completeness of L^p -spaces, Radon-Nikodym theorem.	Create
CO6	understand the definition of outer measure, measurable sets and measurable functions, Lebesgue integrals of different types of functions, abstract measure on a measurable space, signed measure.	

Syllabus

Units	Content	Hrs.
I	Definition of Lebesgue outer measure of a subset of R and its properties, definition of a Lebesgue measurable set, the sigma-algebra of Lebesgue measurable sets, every interval is Lebesgue measurable, Cantor (ternary) set, the inner and outer regularity of Lebesgue measurable sets - Borel sigma algebra.	12
II	Lebesgue measurable functions on R, liminf and limsup of measurable functions, simple functions, any non-negative measurable function is the limit of an increasing sequence of simple functions, existence of non-measurable sets.	12
III	Lebesgue integrals of simple functions, non-negative measurable functions, any real valued measurable function, Fatou's lemma, monotone convergence theorem, dominated and bounded convergence theorems.	12
IV	Integral of series, Riemann integrability implies the Lebesgue integrability (statement only). Abstract measure theory: σ-algebra B of subsets of a set X, measurable space, measure space, integral of measurable functions over abstract measure space.	12
V	Signed measure, Hahn decomposition, Jordan decomposition, Lebesgue decomposition theorem, Radon-Nykodim theorem.	12

Partial Differential Equations

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the relation between the theory and modelling in the problems arising in various fields, such as, economics, finance, applied sciences and etc.,	Remember/ Understand
CO 2	enhance their mathematical understanding in representing solutions of partial differential equations.	Apply
CO 3	classify the partial differential equations and transform into canonical form	Analyze
CO 4	determine the solution representation for the three important classes of Partial Differential Equations, such as Laplace, Heat and wave equation by various methods.	Evaluate
CO 5	formulate fundamentals of partial differential equations, like Green's function, maximum principles, Cauchy problem, to take a research career in the area of partial differential equations	Create

Syllabus

Units	Content	Hrs.
I	First-order partial differential equations, well-posed problems in the sense of Hadamard, geometrical interpretation of a first-order equation, Cauchy problem, method of characteristics, compatible systems, Jacobi's method. initial value problems.	14
II	Second order partial differential equations, genesis of second order partial differential equations, classification of second order partial differential equations in to hyperbolic, elliptic, and parabolic partial differential equations, canonical forms, Cauchy-Kowalewskaya theorem	10
III	Wave Equation: D'Alembert's formula, uniqueness, and stability of solutions to the initial value problem for one-dimensional wave equation, method of spherical means, Hadamard's method of descent. Duhamel's principle for solutions of the non-homogeneous wave equation, uniqueness using the energy method, Riemann method, separation of variables.	12
IV	Laplace equation: Green's identities, the uniqueness of solutions to Dirichlet and Neumann boundary value problems, fundamental solutions, mean value property, properties of harmonic functions, maximum principle and uniqueness, regularity, Liouville's theorem, Green's function for Dirichlet boundary value problem on upper half-space and ball. Energy method: Uniqueness, Dirichlet principle, separation of variables, Laplace and beam equations.	12
V	Heat equation: Fundamental solution. Cauchy problem for homogeneous heat equation. Duhamel's principle for non-homogeneous heat equation, maximum principle and uniqueness. Energy method: Uniqueness, backward uniqueness, separation of variables.	12

Multivariate Calculus

Course Outcome (CO)

On completion of the course the students will be able to

	Course outcome	**Level**
CO 1	understand the concepts of directional derivatives, total derivatives, multiple integrals and their properties.	Remember/ Understand
CO 2	solve problems using the Gauss, Stokes, and Divergence theorems	Apply
CO 3	examine the relations among the partial derivatives and total derivative, interchanging the order of the derivatives, interchanging the order of integrations.	Analyze
CO 4	discuss the proofs of Green's theorem, Stoke's theorem and Gauss divergence theorem.	Evaluate
CO 5	find examples to explain the differences between partial derivative, directional derivative and total derivative.	Create

Syllabus

Units	**Content**	**Hrs.**
I	Partial derivatives, directional derivative and total derivative of differentiable scalar valued (and vector valued) functions on R^n, total derivative expressed in terms of partial derivatives.	12
II	Jacobian matrix, chain rule, matrix form of the chain rule, mean value theorem for differentiable functions, a sufficient condition for differentiability, a sufficient condition for equality of mixed partial derivatives, Taylor's formula for functions from $R^n \rightarrow R$, Mean-value theorem and applications.	12
III	Higher order derivatives, interchanging order of derivatives, Taylor's theorem for scalar valued functions, inverse mapping theorem, implicit mapping theorem, extrema of real-valued functions of several variables.	12
IV	Multiple integrals, partitions of rectangles and step functions, double integral, double integral as volume, integrability of functions, applications to area and volume, Pappus's theorem, Green's theorem and its applications, change of variables and transformation formula.	12
V	Surface, fundamental vector product, area of a parametric surface, surface integrals, Stoke's theorem, curl, Gradient and divergence of a vector field, divergence theorem, line integrals, proofs of theorems of Gauss.	12

Number Theory

Course Outcome (CO)

On completion of the course the students will be able to

	Course outcome	Level
CO 1	understand the concepts of divisibility of integers, fundamental theorem of arithmetic.	Remember/ Understand
CO 2	apply the notion of congruence, and its properties.	Apply
CO 3	examine the Dirichlet product of two arithmetic functions, Bell series and their properties.	Analyze
CO 4	solve problems on number theory.	Evaluate
CO 5	find the properties of Euler's totient function, Mobius function, Mangoldt function, Liouville's function, multiplicative functions, and completely multiplicative functions.	Create

Syllabus

Units	Content	Hrs.
I	Natural numbers, arithmetic and order properties, law of well ordering principle, induction principle, equivalence of well ordering and induction principle, integers-ring structure.	9
II	Divisibility, division algorithm, prime numbers, GCD and LCM, Bezout's identity. Euclid's algorithm, fundamental theorem of arithmetic. linear Diophantine equations.	9
III	Congruences, residue classes, arithmetic of congruences, Chinese remainder theorem.	9
IV	Congruences with a prime-power modulus, the arithmetic of Z_p, pseudoprimes and Carmichael numbers, solving congruences mod p^l.	9
V	Euler phi function. multiplicative functions, Euler's theorem and Fermat's theorem, group of units	9

Research Methodology and Publication Ethics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand an objective of doing research, research process, and various kinds of research	Remember / Understand
CO 2	perform literature reviews using the available databases	Apply
CO 3	have basic knowledge on qualitative research techniques and know the limitation of certain research methods	Analyze
CO 4	be familiar with the significance of research ethics and use of research ethics into the research process	Evaluate
CO 5	develop a quality research proposal and advanced critical thinking skills	Create

Syllabus

Units	Content	Hrs.
I	Objectives of research, types of research, research approaches, Importance of knowing how research is done, research process, criteria of good research. Literature review, finding a research problem, how to read research article (a case study), methods and processes for solving the problem.	6
II	Scientific misconducts: falsification, fabrication and plagiarism. Redundant publications: duplicate and overlapping publications, predatory publishers and journals, open access publications, use of plagiarism software and other open source software tools.	6
III	Web of Science, Science Citation Index (SCI), journal impact factors, h-index, g-index, i10 index, Math Review, E-Journals and books, search engines and databases, conference, symposium, workshop, presentation, lecture notes, proceedings, volumes, issues, referees, editors, authors, single author and many authors, first author, corresponding author, percentage of author's contributions.	6
IV	Writing the abstract, the literature review. The nature and varieties of thesis, characteristics of good thesis, the intellectual content of the thesis, layout of the thesis, structure and components of research reports, technical report writing and presentation in LATEX (a case study).	6
V	Mathematical writing, writing a paper, publishing a paper, writing and defending a thesis, procedure of submitting the thesis, the structure of the viva, defending the thesis, writing a talk, preparing a poster,	6

Semester IX

Course Code: MAT1091 **Credit: 4**

Functional Analysis

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	explain the concepts of normed linear space, continuity of a linear map, L_p-space, Banach, Hilbert spaces, four pillars	Remember/ Understand
CO 2	demonstrate the convergence in the different types of spaces	Apply
CO 3	analyze the properties of different types of normed linear space	Analyze
CO 4	determine the linear functional in terms orthonormal basis	Evaluate
CO 5	obtain the open mapping theorem from closed graph theorem and vice-versa	Create

Syllabus

Units	Content	Hrs.
I	Normed Linear spaces, Banach spaces, X is complete iff $\{x : \|x\| \leq 1\}$ is complete, direct sum of Banach spaces, quotient space, l^n_p and l_p spaces (including the proof of Holder's and Minkowski's inequalities), $\|.\|_p \to \|.\|_\infty$ as $p \to \infty$, the spaces of continuous bounded functions C(X, **R**) and C(X, **C**).	12
II	Bounded linear transformations, equivalences of continuous linear transformations, norm of a bounded linear transformation and its properties, the space B(X, Y) bounded linear transformations, completenessof B(X,Y), equivalence of different norms on a space linear space, every linear transformation from a finite dimensional normed linear space is continuous, dual space (the space of continuous linear functionals), examples: duals of l^p and l_n^p, Hahn-Banach extension theorem (for both real and complex cases), applications of Hahn-Banach theorems.	12
III	Natural imbedding of X in X^{**}, reflexive spaces, l^n_p are reflexive, weak topology on X^*, strong topology on X^*, a Banach space is reflexive iff its closed unit sphere is compact in the weak topology, weak*-topology on X^*, closed unit ball in a normed linear space is always compact Housdorff in the weak*-topology, o pen mapping theorem, projections on Banach spaces, direct sums and projections, closed graph theorem, conjugate of an operator and its properties.	12
IV	Inner product spaces, Hilbert spaces, Cauchy-Schwartz inequality, l^n_2 and l_2 spaces, parallelogram law, closed convex set has a unique vector of minimum norm, polarization identity, Pythogorean theorem, orthogonal complement and its properties, best approximation of a closed subspace of a Hilbert space exists and it is in the orthogonal complement $H = M \oplus M^\perp$, for any closed subspace M, orthonormal sets, examples, Bessel's inequality, equivalences of orthonormal basis, Fourier series, Riezs representation theorem, Gram-Schmidt's orthogonalization process, conjugate space H^*.	12

V	Adjoint of an operator and its properties, self adjoint operator-positive operators and inequality on self-adjoint operators, normal and unitary operators, projections, spectral theorem for finite dimensional Hilbert spaces.	12

Probability Theory

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concept of random variables and the probability distributions	Remember / Understand
CO 2	apply Poisson, Gamma, Chi-square and other distributions to solve real life problems	Apply
CO 3	compare discrete and continuous random variables	Analyze
CO 4	derive the probability density function, distribution function of various random variables, and derive the marginal and conditional distributions of bivariate random variables	Evaluate
CO 5	translate real-world problems into probability models	Create

Syllabus

Units	Content	Hrs.
I	Random experiments and probability sample space, sample points, events, axioms of probability, probability of union of events, sample spaces with equally likely outcomes, probability as a continuous set function.	12
II	Conditional probability and independence of events: motivation for conditional probability, shrinking of sample space when it is known that a certain event occurred, conditional probability, independence of events, independent events and disjoint events, bayes' theorem and posterior probabilities.	12
III	Discrete random variables: Definition, distribution, examples, probability mass function and distribution function, properties of a distribution function, expected value, variance of a random variable, Bernoulli, binomial, geometric and negative binomial distributions, Poisson distribution and hypergeometric distribution, distribution functions, means and variances of various distributions mentioned above, Poisson random variable as an approximation of binomial random variable.	12
IV	Continuous random variables: Probability density function and distribution function, examples, expectation and variance of continuous random variables, need they always exist (Cauchydistribution), uniform distribution, normal distribution, use of the table of probabilities of standard normal distribution, normal approximation of binomial distribution, exponential distribution, gamma, chi-square, beta and F-distributions, Weibull and Cauchy distributions, Chebychev's inequality and its applications.	12

V	Joint distribution of two or more random variables, joint distribution functions, examples, covariance between two random variables, independence of random variables, uncorrelatedness and independence, pairwise independence and mutual independence, sums of independent random variables, marginal and conditional distributions, conditional distribution: discrete and continuous cases, bivariate normal distributions, weak law of large numbers, statements of central limit theorem.	12

Computational Mathematics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	remember the finite difference formulae for derivatives	Remember/ Understand
CO 2	apply the basics of analysis to estimate error while solving partial differential equations numerically	Apply
CO 3	analyze the stability property of solutions of partial differential equations	Analyze
CO 4	evaluate the robustness of the algorithms and how fast the numerical results converge to the analytical solutions.	Evaluate
CO 5	design algorithms to solve scientific problems that cannot be solved exactly	Create

Syllabus

Units	Content	Hrs.
I	Introduction to finite differences: Finite difference approximations to derivatives, notations, finite difference method, linear problem with Dirichlet and non-Dirichlet boundary conditions, nonlinear problems.	9
II	Elliptic partial differential equations: Poisson equation on a rectangular domain, Dirichlet boundary conditions, non-Dirichlet boundary conditions, solving the discrete equation, relaxation methods, convergence analysis.	9
III	Parabolic partial differential equations: The heat equation with Dirichlet boundary conditions, forward, backward and Crank-Nicolson method, absolute stability.	9
IV	Parabolic partial differential equations: General parabolic equations, non-Dirichlet boundary conditions, stability analysis, problems in two spatial domains.	9
V	Hyperbolic partial differential equations: Advection equation, upwind differencing, stability analysis, MacCormack method, the wave equation, stability analysis	9

Mathematical Methods

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the idea about functional and its properties	Remember / Understand
CO 2	solve Fredholm, Volterra and singular integral equations	Apply
CO 3	analyze the Fredholm theory	Analyze
CO 4	determine the solutions of Brachistochrone problem, geodesics problems and isoperimetric problems	Evaluate
CO 5	formulate the knowledge of calculus of variation to solve a wide range of real-world problems of applied sciences	Create

Syllabus

Units	Content	Hrs.
I	Integral equation: Introduction, types of integral equations, integral equations with separable kernels, reduction to a system of algebraic equations, Fredholm alternative, an approximate method, Fredholm integral equations of the first kind, method of successive approximations, iterative scheme, Volterra integral equation, some results about the resolvent kernel, classical Fredholm theory - Fredholm's method of solution, Fredholm's first, second, third theorems (without proof).	12
II	Applications of integral equations: Application to ordinary differential equation, reduction of initial value problems and boundary value problems to integral equations, Green's function approach, singular integral equations, Abel integral equation.	12
III	Symmetric kernels: Introduction, fundamental properties of eigenvalues and eigenfunctions for symmetric kernels, s olution of a symmetric integral equation, Rayleigh-Ritz Method. (if time permits)	12
IV	Calculus of variations: Functionals, variation of a functional, Euler-Lagrange equation, necessary and sufficient conditions for extrema, functional dependent on higher-order derivatives, functional dependent on the function of several independent variables, variational problems in parametric form, sufficient condition for weak/storing extremum.	12
V	Direct methods in variational problems: Direct Methods, Euler's finite difference methods, The Ritz method, Kantorovich's method.	12

Fluid Dynamics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO1	understand the basic properties and principles of viscous and non-viscous fluids	Remember/ Understand
CO2	derive and deduce the consequences of the governing equations of fluids	Apply
CO3	solve kinematics problems such as finding particle paths and streamlines	Analyze
CO4	understand the basic theorems of fluid mechanics and its applications	Evaluate
CO5	derive the boundary layer equations of some basic flows and its solutions	Create

Syllabus

Units	Content	Hrs
I	Kinematics of fluids in motion: Real and ideal fluids, coefficientof viscosity, steady and unsteady flows, isotropy. orthogonal curvilinear coordinates, velocity of a fluid particle, material local and convective derivative, acceleration, stress, rate of strain, vorticity and vortex line, stress analysis, relation between stress and rate of strain, streamline, path lines, streak lines, velocity potential, Eulerian and Lagrangian forms of equation of continuity., boundary conditions and boundary surfaces.	12
II	Equations of motion of a fluid: Pressure at a point in a fluid, Euler's equations of motion, momentum equations in cylindrical and spherical polar coordinates. conservative field of force, flows involving axial symmetry, equations of motion under impulsive forces, potential theorems.	12
III	In viscid flows: Energy equation, Cauchy's integrals, Helmholtz equations, Bernoulli's equation and applications, Lagrange's hydro-dynamical equations, Bernoulli's theorem and applications, Torricelli's theorem, trajectory of a free jet, pitot tube, venturi meter.	12
IV	Two dimensional and irrotational motion: Two-dimensional flows, stream function, complex potential, irrational and incompressible flow, complex potential for standard two-dimensional flows, Cauchy Riemann equations in polar form, magnitude of velocity, sources and sinks in two dimensions, problems. kinetic energy of liquid, theorem of Blasius, complex potential due to source.	12
V	Doublet in two dimensions, Milne Thomson circle theorem, flow and circulations, Stoke's theorem, Kelvin circulation theorem, kinetic energy of infinite liquid. kelvins minimum energy theorem, permanence if irrotational motion, vortex motion, dynamical similarity, boundary layer theory.	12

Transformation Groups

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand Groups of bijections	Remember/ Understand
CO 2	be able to prove that the isometries the plane are given by translation, rotation, reflections and glide reflections.	Apply
CO 3	understand Affine and Projective Transformations	Analyze
CO 4	understand the standard methods of solving ODEs with the help of symmetries	Evaluate
CO 5	be able solve problems on these topics	Create

Syllabus

Units	Content	Hrs.
I	Revision of group theory: Homomorphism, quotient group, groups presented by generators and relations, group actions and orbits.	12
II	Affine transformations, Isometries in $\mathbf{R}^2$, translation, rotation, reflection, and glide reflection.	12
III	Projective space, projective transformations.	12
IV	Affine and projective coordinates.	12
V	Symmetries of Differential Equation: Ordinary differential equations, change of variables, The Bernoulli equation, point transformations, one-parameter groups, symmetries of differential equations, solving equations by symmetries.	12
	References: 1. S. V. Duzhin and B. D. Chebotarevsky, Transformation Groups for beginners, AMS, 2004. 2. T. T. Dieck, Transformation Groups, Walter de Gruyter, 1987. 3. N.V. Efimov, Higher Geometry, Mir publications, 1980.

Design & Analysis of Algorithms

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	study some of the basic and key techniques to analyze and design algorithms	Remember / Understand
CO 2	see the practical applications of algorithms and the impact of the same	Apply
CO 3	have hands on experience in conducting a few challenging scientific computing	Analyze
CO 4	develop real-life problem-solving capability	Evaluate
CO 5	connect the theory and computing	Create

Syllabus

Units	Content	Hrs.
I	Introduction to algorithms, lots of examples, recurrent relations and closed form solution, tools and techniques for summation, manipulation ofsum, floor and ceiling functions, finite and infinite calculus, problem solving using the tools	12
II	Number theory an applied perspective, divisibility, introduction to relations and functions, mod and congruence relation, application of congruence, independent residues.	12
III	Permutation, permutation of multi sets, combination, application of permutation and combination, combinatorial properties of permutations.	12
IV	Design and analysis of algorithms with examples like Euclid algorithm etc.,	12
V	Sorting, insertion sort, divide and conquer approach, merge sort, quicksort, asymptotics and analysis, complexity theory, polynomial time, complexity classes, class P, NP, NPC, reducibility, NP completeness problems, scientific computing with open-source R.	12

Nonlinear Programming

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	learn about convex sets and functions, characterization of convex functions.	Remember / Understand
CO 2	study the characterization of global optimality of a convex program.	Apply
CO 3	study the optimality conditions of linear and nonlinear programs.	Analyze
CO 4	appreciate the beauty of Lagrangian duality, weak and strong duality theorems.	Evaluate
CO 5	understand about the algorithmic maps and its convergence.	Create

Syllabus

Units	Content	Hrs.
I	Introduction to optimization problems (real life examples, constrained and unconstrained, convex and non-convex etc.,). Convex sets, convex hull, Caratheodory's theorem, separation theoremand Farka's lemma. (Standard fixed point theorems without proof after teaching Farka's lemma), convex functions, first and second derivative convexity characterizations, Euclidean(metric) projection on a convex set.	12
II	Necessary and sufficient conditions for local and global optimality of a feasible point, Weierstrass Theorem, definition of descent direction and a sufficient condition for descent direction.	12
III	Optimality conditions, definitions of normal cone, cone of feasible directions and tangent cone, relationship between these cones.optimality conditions based on these cones. Fritz John optimality conditions and KKT optimality conditions, different constraint qualifications (Abadie's CQ, Mangasarian-Fromovitz CQ, Slater CQ, Linear independence CQ) and their relationship with KKT optimality conditions.	12
IV	Lagrangian Duality: Lagrangian dual problem, examples to find the dual of a linear as well as nonlinear programming problems, Lagrange multipliers and its relation to global optimality, convexity of dual problem, duality gap and existence of Lagrange multipliers, global optimality conditions in the absence of duality gap, saddle point and global optimality, weak and strong duality theorems for convex programs, explained how these theorems work for linear and quadratic programming problems.	12

V	Definition of sub-gradient for a convex function, example of a dual problem with non differentiable objective, sub-gradient projection algorithm for convex problems, algorithms and algorithmic maps, examples of algorithms and algorithmic maps, Zangwill's convergence theorem (without proof).	12
	References: 1. O. Mangasarian, Nonlinear programming, Mc Graw-Hill Inc., 1969. 2. M. S. Bazaraa, H. D. Sherali and C. M. Shetty, Nonlinear programming, Wiley- Blackwell, 2006 3. N. Andreasson, A. Evgrafov and M. Patriksson, An Introduction to Continuous optimization, Springer, 2013.

Introduction to Lie Algebras

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	Understand the topological groups and its properties in general and to study the group of $GL_n(R)$ and its various subgroups and their topological properties.	Remember / Understand
CO 2	know various decompositions available for different matrix classes and its applications.	Apply
CO 3	Analyze the maps like exponential and logarithm of a matrix, its properties.	Analyze
CO 4	find linear Lie groups, its Lie algebras and Campbell-Hausdorff formula.	Evaluate
CO 5	learn Lie algebras and its representations, nilpotent, solvable Lie algebras and semi-simple Lie algebras.	Create

Syllabus

Units	Content	Hrs.
I	Review of the following: exponential and logarithmic functions of real and complex variables, inverse function theorem, triangularizability, diagonalizability and simultaneous diagonalizability of matrices,Jordan canonical form, Topology: Hausdorff topology, continuity,compactness and connectedness, Groups: Normal groups, homomorphism between groups, nilpotent and solvable groups, total derivatives and chain rule.	12
II	Topological Groups, the group $GL(n,\mathrm{R})$, Examples of subgroups of $GL(n,\mathrm{R})$, polar decomposition in $GL(n,\mathrm{R})$, the orthogonal group, Gram decomposition.	12
III	Exponential and logarithm of a matrix, total derivative of the exponential.	12
IV	Linear Lie groups: One parameter semigroups and subgroups, Lie algebra of a linear lie group, linear lie groups as sub-manifolds, Campbell-Hausdorff formula.	12
V	Lie algebras: Definitions and examples, nilpotent and solvable Lie algebras, semi-simple Lie algebras.	12

Advanced Partial Differential Equations

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the theory of weak solutions	Remember / Understand
CO 2	apply the theory of functional analysis to study weak solutions of PDEs	Apply
CO 3	analyze existence, uniqueness and regularity of solutions for PDEs	Analyze
CO 4	determine the necessary conditions for the existence of extremals	Evaluate
CO 5	develop the relation between nonlinear partial differential equations and calculus of variations	Create

Syllabus

Units	Content	Hrs.
I	Elliptic equation: Weak solution, Lax-Milgram theorem, energy estimates, regularity, maximum principles	12
II	Parabolic equation: Weak solution, existence and uniqueness, regularity, maximum principles	12
III	Hyperbolic equation: Weak solution, existence and uniqueness, regularity, propagation of disturbances	12
IV	Calculus of variation: Basic ideas, first variation, Euler-Lagrange equation, second variation, Systems: Null Lagrangians, Brouwer's fixed point theorem	12
V	Existence of minimizers: coercivity, lower semi continuity, convexity, weak solutions of Euler-Lagrange equations, systems.	12

Differential Geometry

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand plane curves and their curvature	Remember/ Understand
CO 2	understand surfaces, tangents and normal	Apply
CO 3	understand Quadratic Surfaces	Analyze
CO 4	understand concepts related to curvature of surfaces	Evaluate
CO 5	be able to solve problems on these topics.	Create

Syllabus

Units	Content	Hrs.
I	Plane curves and space curves, Frenet-Serret formulae, global properties of curves, simple closed curves, the isoperimetric inequality, the Four Vertex theorem.	12
II	Surfaces in three dimensions, smooth surfaces, tangents, normals and orientability, quadric surfaces.	12
III	The first fundamental form, the lengths of curves on surfaces, isometries of surfaces, conformal mappings of surfaces, surface area, Equiareal maps and a theorem of Archimedes.	12
IV	Curvature of surfaces, the second fundamental form, the curvature of curves on a surface, normal and principal curvatures.	12
V	Gaussian curvature and the Gauss' Map, the Gaussian and the mean curvatures, the pseudo sphere, flat surfaces, surfaces of constant mean curvature, Gaussian curvature of compact surfaces, the Gauss' map.	12

Delay Differential Equations

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	be able to solve simple delay differential equations	Remember/ Understand
CO 2	be able to apply numerical techniques to delay differential equations	Apply
CO 3	understand infinite dynamical systems via the semi-group approach	Analyze
CO 4	be able to apply Hille-Yosida Theorem to show existence of solutions to delay differential equations	Evaluate
CO 5	understand stability of delay differential equations	Create

Syllabus

Units	Content	Hrs.
I	Review of system of ordinary differential equations, solution of nonlinear system as given by groups of operators, stability and asymptotic stability.	12
II	Solution of parabolic/hyperbolic equations as semigroups/ groups.	12
III	Backward Euler method as a motivation for Hille-Yoshida theorem without proof, existence for delay differential equations.	12
IV	Models involving delay differential equations: Population model, predator model with delay, logistics equations, pantograph equations.	12
V	Asymptotic stability of linear delay differential equations, Spectral theorem for compact linear maps, compact semi-groups, growth bounds.	12
	References: 1. J. Hale, Theory of Functional Differential Equations, Springer-Verlag, New York, 1997. 2. V. J. Arnold, Ordinary Differential Equations, Springer-Verlag, Berlin, 1982. 3. S. Kesavan, Topics in Functional Analysis and Applications, John Wiley & Sons, 1989.

Foundations of Geometry

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the five groups of Axioms of Geometry	Remember/ Understand
CO 2	understand the compatibility and mutual independence of the axioms	Apply
CO 3	understand the theory of proportion	Analyze
CO 4	understand plane areas	Evaluate
CO 5	understand Desargues's h delay differential equations theorem	Create

Syllabus

Units	Content	Hrs.
I	The elements of geometry and the five groups of axioms, Group I: Axioms of connection Axioms of Order, Consequences of the axioms of connection and order, Axiom of Parallels (Euclid's axiom), Axioms of congruence, Consequences of the axioms of congruence, Axiom of Continuity (Archimedes's axiom).	12
II	Compatibility of the axioms, Independence of the axioms of parallels. Non-euclidean geometry, Independence of the axioms of congruence, Independence of the axiom of continuity. Non-archimedean geometry.	12
III	Complex number-systems, Demonstration of Pascal's theorem, An algebra of segments, based upon Pascal's theorem, Proportion and the theorems of similitude, Equations of straight lines and of planes	12
IV	Equal area and equal content of polygons, Parallelograms and triangles having equal bases and equal altitudes, The measure of area of triangles and polygons, Equality of content and the measure of area.	12
V	Desargues's Theorem, its demonstrations and applications.	12
	References. 1. D. Hilbert, The Foundations of Geometry, MJP Publishers, 1902. 2. S. Kumaresan and G. Santhanam, An Expedition to Geometry, Hindustan Book Agency, 2011. 3. N. V. Efimov, Higher Geometry, Mir publications, 1980.

Commutative Algebra

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO 1	understand the difference between vector space over a field and module over a commutative ring.	Remember/ Understand
CO 2	apply some operations, obtain a new module from old the old ones.	Apply
CO 3	find the fraction rings and fraction modules from given the rings and modules	Analyze
CO 4	obtain a characterization for Noetherian A-module and Artinian A-module using submodules and the chain conditions.	Evaluate
CO 5	investigate the Hilbert's basis theorem for Noetherian ring of polynomials	Create

Syllabus

Units	Content	Hrs.
I	Commutative ring with unity, zero-divisors, nilpotent elements, nilradical Jacobson radical, modules, module homomorphism.	12
II	Submodules, quotient modules, operations on submodules, direct sum, finitely generated modules, Nakayama's lemma, exact sequences	12
III	Rings and modules of fraction local properties	12
IV	Chain conditions, Noetherian A-module and its characterization, Noetherian rings, Hilbert's basis theorem	12
V	Artinian A-modules and its characterization, Artinian rings	12
	References: 1. M. F. Atiyah and I. G. MacDonald, Introduction to Commutative Algebra, Addison- Wesley, Reading, 1969. 2. N. S. Gopala Krishnan, Commutative Algebra, Second Edition, University Press, 2015. 3. D. S. Dummit and R. M. Foote, Abstract Algebra, Third edition, Wiley, 2004.

Advanced Graph Theory

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO 1	understand the concept of maximum matching and perfect matching	Remember/ Understand
CO 2	demonstrate Euler tour and Hamiltonian cycle in graphs using a characterization of Eulerian graph properties of Hamilton graphs	Apply
CO 3	find a triangle free graph with arbitrarily large chromatic number	Analyze
CO 4	determine Euler formula for a planer graph in terms of its n, m, ϕ	Evaluate
CO 5	create a schedule for a tournament in a particular game using tournament of the di-connected graphs	Create

Syllabus

Units	Content	Hrs.
I	Matching, maximum matching, Berge theorem in maximum matching. Hall's theorem, perfect matching, Tutte theorem.	12
II	Eulerian graphs and its characterization, Vizing's theorem in edge Colourings, independent sets, Gallai's theorem, Ramsey theory	12
III	Turan's theorem, Brook's theorem in vertex colourings, Hajo's conjecture, subdivision of graphs, Mycielski's construction for triangle free graphs.	12
IV	Kuratowski's theorem, face colouring, characterization of face Colouring, Tait colouring, non Hamiltonian planar graphs.	12
V	Directed graphs, existence of directed path, tournament, disconnected tournament, Moon theorem, networks, Max-flow min-cut theorem.	12

Mechanics

Course Outcome (CO)

On completion of the course, the student will be able to

CO	Course Outcome	Level
CO 1	understand constraints, Kepler Problem and inverse-Square Law of Force	Remember/ Understand
CO 2	apply advanced methods to complex central-force motion problems	Apply
CO 3	distinguish the concept of the Hamilton equations of motion and the principle of least action	Analyze
CO 4	compare the conservation theorems using Hamilton's and D Alembert's principle	Evaluate
CO 5	formulate the conditions of closed orbits in a motion	Create

Syllabus

Units	Content	Hrs.
I	Mechanics of system of particles, conservation theorems, conservative forces with examples, constraints, generalized co-ordinates. D'Alembert's principle, Lagrange's equations of motion, the forms of Lagrange's equations of motion for non conservative systems and partially conservative and partially non conservative systems, kinetic energy as a homogeneous function of generalized velocities, simple applications of the Lagrangian formulation.	12
II	Cyclic co-ordinates and generalized momentum conservation theorems, calculus of variation, Euler Lagrange's equation, first integrals of Euler Lagrange's equation, the case of several dependent variables, geodesics in a plane, the minimum surface of revolution, Brachistochrome problem, isoperimetric problems, problems of maximum enclosed area.	12
III	The central force problem, reduction to the equivalent one body problem, the equation of motion and the first integrals, the equivalent one-dimensional problem and classification of orbits, the virial theorem.	12
IV	The differential equation of the orbit, the integrable power law potentials, conditions for closed orbit, Betrand's theorem, the Kepler problem, the inverse square law of force, the motion in time in the Kepler problem, Laplace Runge Lenz vector.	12
V	Legendre transformation and the Hamilton equations of motion, cyclic coordinates and conservation theorem, Hamiltonian canonical equations of motion, derivation of Hamilton's equation from variational problem, the principle of least action, Jacobi's form of the least action principle.	12

Discrete Dynamical Systems

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO 1	appreciate the basics of topological dynamics with the help of illustrous examples, understand that not only period three maps or chaotic, there are lot more using Sarkoviskii's theorem.	Remember / Understand
CO 2	discuss on the concept of attracting, repelling periodic points and understand the theory of bifurication and apply them.	Apply
CO 3	be well versed in Symbolic dynamics, get an expertise in topological conjugacy.	Analyze
CO 4	thoroughly understand Newton's method in the preview of DDS.	Evaluate
CO 5	appreciate complex dynamics, self similarity and Mendolbortt sets.	Create

Syllabus

Units	Content	Hrs.
I	Orbits, phase portraits, periodic points and stable sets, Sarkovskii's theorem.	12
II	Attracting and repelling periodic points, differentiability and its implications, parametrized family of functions and bifurcations, the logistic map.	12
III	Symbolic dynamics, devaney's definition of Chaos, topological conjugacy.	12
IV	Newton's method, numerical solutions of differential equations.	12
V	The dynamics of complex functions, the quadratic family and the Mandelbrot set.	12
	References 1. R. A. Holmgren, A First Course in Discrete Dynamical Systems, Springer Verlag, 1994. 2. R. L. Devaney, A First Course in Chaotic Dynamical Systems, Addison-Wesley Publishing Company, Inc. 1992.

Combinatorial Mathematics

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO1	understand the concept of permutations, combinations, inclusion-exclusion principle and Polya's theory	Remember / Understand
CO2	solve some combinatorial problems using inclusion-exclusion principle and Polya's theory	Apply
CO3	form recurrence relations from combinatorial problems	Analyze
CO4	solve the recurrence relations using different techniques	Evaluate
CO5	use combinatorial ideas to solve problems from other areas of Mathematics	Create

Syllabus

Units	Content	Hrs.
I	Permutations, combinations, distribution of distinct objects, distribution of non-distinct objects.	12
II	Generating functions for permutations, distributions of distinct objects into non-distinct cells, partitions of integer, elementary relations.	12
III	Recurrence relations, linear recurrence relations with constant coefficients, solution by the technique of generating functions, recurrence relation with two indices.	12
IV	The principle of inclusion and exclusion, general formula, derangements, permutations with restrictions on relative positions.	12
V	Polya's theory of counting, equivalence classes under a permutation group, equivalence classes of functions, weights and inventories of functions, polya's fundamental theorem.	12

Introduction to Game Theory

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO 1	study real vector spaces and linear transformations on these spaces.	Remember/ Understand
CO 2	apply linear programming and the theory of duality for the linear programs.	Apply
CO 3	analyze the simplex method, its working principle and usingthe algorithm to find the optimal of both primal and dual problems.	Analyze
CO 4	understand two person zero-sum matrix games, existence Nash equilibrium/optimal strategies for such games.	Evaluate
CO 5	apply iterated elimination of dominated strategies(IEDS) procedure on a matrix game, formulate the problem of finding Nash equilibrium as a linear program and compute the optimal strategies using simplex method.	Create

Syllabus

Units	Content	Hrs.
I	Linear algebra: Vectors, scalar product, matrices, linear inequalities, solution of linear equations, real vector spaces of finite dimensions, linear transformations.	12
II	Convex sets and polytopes, convex cones, extreme vectors and extreme solutions for linear inequalities.	12
III	Linear programming: Example problems, formulation of linear programming problem, primal and dual problem, simplex method and its variations for solving linear programming problems, duality theorem.	12
IV	Two-person games: Examples, definitions and elementary theory, solutions of games, pure and mixed strategies, value of the game and optimal strategies, saddle point and minimax theorem, symmetric games, proof of fundamental theorem of games.	12
V	Solutions to matrix games: Relation between matrix games and linear programming, solving games by the simplex method, optimal strategies and solutions.	12

Python for Sciences

Course Outcome (CO)

On completion of the course, the student will be able to

	Course Outcome	Level
CO 1	comfortably use Linux command line, VI editor and necessary basic commands of Linux. Python basics.	Remember / Understand
CO 2	use various data types in Python for storing list of items.	Apply
CO 3	write basic Python programs and functions using conditionals and loop structures.	Analyze
CO 4	write Python programs for various numerical algorithms.	Evaluate
CO 5	work with the Numpy and Scipy libraries.	Create

Syllabus

Units	Content	Hrs.
I	Introduction to linux commands and VI Editor, overview of installing and running Python, Python interpreter and IDLE, one more text editor GEANY. Simple commands to use Python as a calculator, Python 2.x vs Python 3.x, variables, statements, getting input from the user, functions, modules, running Python scripts from a command prompt. strings, concatenating strings, string representation, repr and str, input vs raw input, string conversions, methods S ¸find, join, lower, replace, split, strip, translate.	9
II	Lists, tuples and dictionaries, lists s ¸indexing, slicing, adding sequences, multiplication, membership, length, minimum and maximum, list operations and methods, tuple operations, creating and using dictionaries, dictionary operations, string formatting with dictionaries, dictionary methods.	9
III	Conditionals and loops, importing libraries, assignment, blocks, if statement, else and elif clauses, nesting blocks. while loops, for loops, iteration, breaking, else clauses in loops, printing and output formatting, format specifiers like align, sign, width, precision, type etc.,. file operations, Python shell error handling, Python exceptions: Try and Except function.	9
IV	Various programs related to basic mathematics followed by Bisection Method, Newton Raphson Method, Regula Falsi Method, Trapezoidal Rule for integration, Simpsons 1/3rd rule, Euler's method for ODE, RK method of ODE etc.,	9
V	Numpy and Scipy: Obtaining Numpy and Scipy libraries, using Ipython, Numpy basics, array creation, printing arrays, basic operations, universal functions, indexing, slicing and iterating, changing shapes, stacking and splitting of arrays, Matplotlib and plotting. Scipy: scipy.special, scipy.integrate, scipy.optimize, scipy.interpolate, scipy.fftpack, scipy.linalg, scipy.stats.	9

Mathematics for the Real World

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand the concept of abstract mathematics.	Remember/ Understand
CO 2	apply simple tricks to write simple equations to solve puzzles mathematically	Apply
CO 3	critically analyze the effectiveness of mathematics in the real world	Analyze
CO 4	evaluate the preciseness and beauty of mathematical concepts that brings out elegant application to real life.	Evaluate
CO 5	see and recognize applications of mathematics in real life situations	Create

Syllabus

Units	Content	Hrs.
I	Mathematics and Mathematicians; what do they do? What is abstraction of ideas? From puzzles to abstract structures, the modulo arithmetic and Chinese reminder theorem.	9
II	Applications of calculus in real world problems; examples and case studies for applications of continuity of functions, integration and convergence.	9
III	Applications of linear algebra; operation research problems from industries; case study on problems from paper industry and PCB board manufacturing.	9
IV	Maxima and minima of functions, Dido's problem, a problem from optics, shortest path taken by light.	9
V	Probability and the gambler's ruin problem, Statistics and its applications in real world, Elections, election procedure, exit polls after an election; application of statistics in pharmaceutical industry etc.,.	9

History of Mathematics

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	know the of contributions to mathematics by different ancient and modern civilizations	Remember/ Understand
CO 2	know about the development of Euclidean and non-Euclidean Geometry	Apply
CO 3	appreciate the contribution of Indians in the fields of Mathematics	Analyze
CO 4	develop gender sensitiveness by learning about the contributions of woman mathematicians	Evaluate
CO 5	appreciate the traditional knowledge of astronomy by Indian	Create

Syllabus

Units	Content	Hrs.
I	Development of Euclidean geometry and non-Euclidean geometries	9
II	The stories of π, e and i .	9
III	Mathematics in different cultures (with special emphasize on Indian Astronomy).	9
IV	Indian Mathematics - Study of Kanakkathikaram and Lilavathi, Ramanujan's contributions; Women Mathematicians - Emmy Noether.	9
V	Development of Modern Mathematics: Hilbert's 23 problems, Gödel's incompleteness theorem, Turing Machine.	9

Mathematics of Kolam

Course Outcome (CO)

On completion of the course the students will be able to

	Course Outcome	Level
CO 1	understand mathematical concepts such as sequence, self-similarity, closed curve, graph and symmetry used in Kolam	Remember/ Understand
CO 2	draw Kolam without lifting the hand	Apply
CO 3	apply the idea of reflection, rotation and translation, and form new Kolam	Analyze
CO 4	find relation between Kolam and number points in Kolam by using the parameters in Mathematics	Evaluate
CO 5	construct a very big self-similarity structure like space filling curves	Create

Syllabus

Units	Content	Hrs.
I	Some simple kolams, odd numbers and even numbers (Ner Pulli, Idaip Pulli)	9
II	Sequence of Kolams, building a big structure by self similarity, connection to fractals.	9
III	The idea of a simple closed curve, Kolams which can be drawn without lifting the pencil.	9
IV	Connection between graph Theory and Kolams: Eulerian and Hamiltonian graphs.	9
V	The ideas of symmetry: reflection, rotation, translation.	9
